# Preface

*Indian Health Surveillance Report – Sexually Transmitted Diseases 2007* presents statistics and trends for sexually transmitted diseases (STDs) among American Indians and Alaska Natives (AI/AN) in the United States. The initial *Indian Health Service Surveillance Report – Sexually Transmitted Diseases*, containing data through 2004, was published in November 2006.

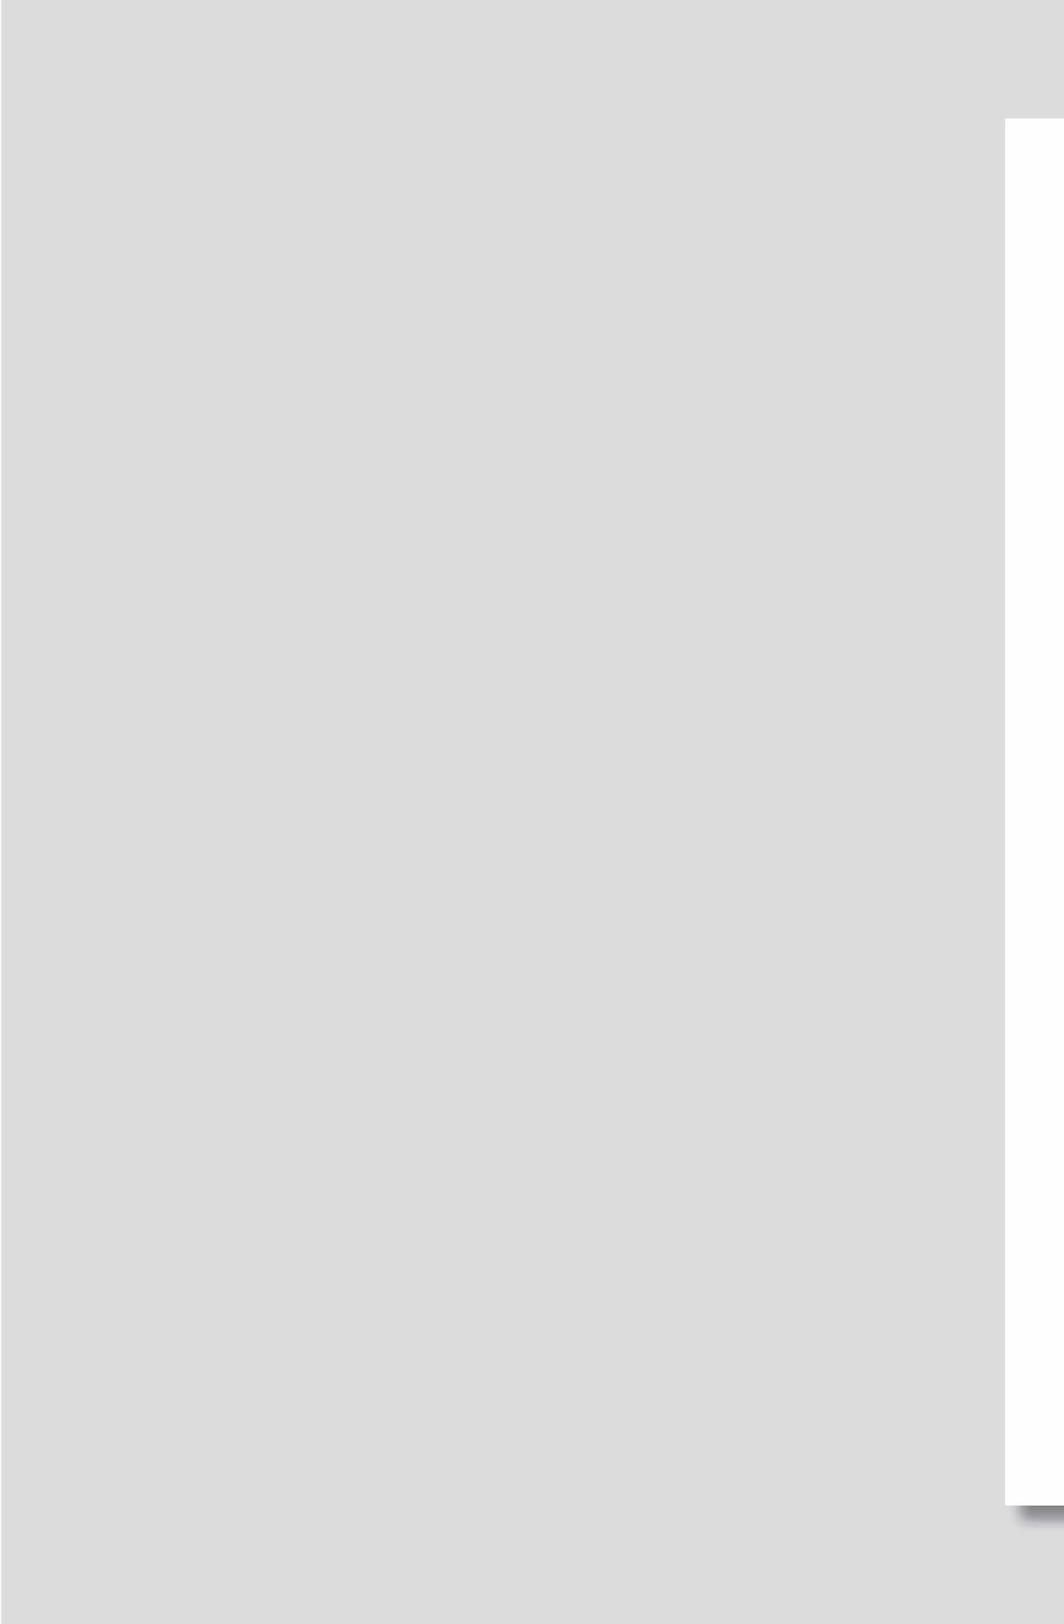

This report is the product of collaboration between the Centers for Disease Control and Prevention (CDC) and the Indian Health Service (IHS). Most of the AI/AN-specific data provided in this report are the result of a new surveillance methodology, whereby existing nationally notifiable STD data reported to CDC were analyzed using standard IHS populations and methods.

*The Indian Health Surveillance Report – Sexually Transmitted Diseases 2007* consists of two main parts. The **National STD Profile** (1984-2007) contains text and figures that provide an overview of STD morbidity among AI/AN in the U.S. The **IHS Area STD Profiles** (1998-2007) present STD rates and trends for the 12 IHS administrative areas.

The surveillance methodology used in this report can serve as a model and framework for analyzing AI/AN specific data for other nationally notifiable diseases (e.g. hepatitis, tuberculosis) and for other priority health conditions (e.g. diabetes, mental health). Such reports are essential for increasing the accessibility and quality of AI/AN health data and play an important role in monitoring disease trends, identifying at-risk populations, and guiding interventions and resources.

Any comments and suggestions that might improve the usefulness of future publications are welcomed and can be sent to the IHS Division of Program Statistics at [IHSStatsHelp@ihs.gov](mailto:IHSStatsHelp@ihs.gov).

# Background

## Rationale for this Report

American Indian and Alaska Native (AI/AN) health data published by the Indian Health Service (IHS) primarily focus on population estimates, natality/mortality, health care finance, and patient care utilization.<sup>1,2</sup> Data specific to STDs and other nationally notifiable diseases are limited. Yet, these diseases represent a significant burden on the IHS health care system and on AI/AN people as a whole.

In 2007, among all races and ethnicities, AI/AN had the second highest rates of chlamydia and gonorrhea and the third highest rate of primary and secondary syphilis (P&S).<sup>3</sup> Improved awareness of these health disparities, through the publication and dissemination of an AI/AN specific STD surveillance report, may lead to increased funding, resources, and research activities in AI/AN communities. In September 2004, collaboration between the Centers for Disease Control and Prevention (CDC) and IHS was initiated to develop such a report.<sup>4</sup> The current report is an update of this report and adds data for 2005-2007.

## IHS Organization

IHS, an agency within the U.S. Department of Health and Human Services (HHS), is responsible for providing federal health services to AI/AN people. The mission of IHS, in partnership with AI/AN people, is to raise their physical, mental, social, and spiritual health to the highest level.

IHS is comprised of 12 regional administrative units called Area Offices or IHS Areas. These IHS Areas include all or parts of 35 states. Within each IHS Area, health care facilities may be operated directly by IHS or may be operated by individual tribes (directly or through several forms of contracted services). Based on 2007 AI/AN population estimates, the largest IHS Area is the Oklahoma City Area, which is home to 37 tribes and a population of 353,513; the smallest IHS Area is the Tucson Area, which is home to 2 tribes and a population of 35,831.

## **CDC Organization**

The Centers for Disease Control and Prevention is also an agency within HHS. The primary mission of CDC is to promote health and quality of life and to prevent and control disease, injury, and disability. CDC is comprised of 15 major organizational units, which are managed through 4 coordinating centers: the Coordinating Center for Environmental Health and Injury Prevention, the Coordinating Center for Health Information and Services, the Coordinating Center for Health Promotion, and the Coordinating Center for Infectious Diseases. The Division of STD Prevention is housed at the National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention, a center within the Coordinating Center for Infectious Diseases.

# Data Sources and Limitations

Nationally notifiable disease data, including data for STDs, are submitted to CDC from state health departments (and other local reporting jurisdictions) and are stored at the National Center for Public Health Informatics (NCPHI), formerly known as the Epidemiology Program Office (EPO). In 2007, there were over 65 nationally notifiable infectious diseases and conditions.<sup>5</sup> Surveillance data for notifiable STDs are electronically sent from NCPHI to the Division of STD Prevention (DSTDP), where they are combined with historical hard copy data (also sent from state and local jurisdictions).

## Numerators: Incident STD Cases Reported to CDC

All of the STD data in this report are based on cases of nationally notifiable STDs reported to CDC from the STD control programs and health departments in the 50 states, the District of Columbia (DC), and selected U.S. cities. In aggregate, the STD cases reported from all of these jurisdictions are used when calculating U.S. rates. STD data from U.S. dependencies and territories (e.g., Guam, Puerto Rico, Virgin Islands) are not included in the U.S. rates or for all other rates used in this report.

AI/AN rates (as shown in the National STD Profile section) are based on STD cases which occurred among persons identified as AI/AN residing in all jurisdictions. In contrast, IHS rates (as shown in the IHS Area STD Profiles) are based on a subset of all AI/AN STD cases. The IHS rates include only STD cases which occurred among AI/AN residing in counties where IHS provides services or resources (see the IHS Denominators section on page 9 for further details); these STD cases may or may not have been diagnosed in IHS, tribal, or urban Indian healthcare facilities. These definitions of AI/AN rates and IHS rates are used consistently throughout this publication.

## STD Data Sources and Reporting Formats

In the past, STD data were submitted by state STD prevention programs to CDC on a variety of hard copy summary reporting forms (monthly, quarterly and annually). As of December 31, 2003, all 50 states and DC had converted from summary hard copy reporting to electronic

submission of line-listed (i.e., case-specific) STD data via the National Electronic Telecommunications System for Surveillance (NETSS). Data reported through NETSS comprise the notifiable disease information that is published in the *Morbidity and Mortality Weekly Report (MMWR)*.

The data presented in the **National STD Profile** are from STD Surveillance System and are based on a combination of aggregated final NETSS electronic data and summary hard copy reporting forms. Monthly hard copy reporting forms include summary data for syphilis by county and state. Quarterly hard copy reporting forms include summary data for gonorrhea, chlamydia, syphilis, and other STDs by sex and source of report (STD clinic or non-STD clinic) for the 50 states, 64 selected cities, and outlying areas of the U.S. Annual hardcopy reporting forms include summary data for chlamydia, gonorrhea, and primary and secondary syphilis (P&S) by age, race, and sex for the 50 states, DC, and 6 large city project areas.

The IHS specific data presented in the IHS Area STD Profiles come only from NETSS and do not include data from hard copy reporting forms. IHS Area data presented in this report require STD datasets which contain both race and county variables in order to determine which cases are AI/AN and to assign cases to the appropriate IHS Area (based on the patient's county of residence). These variables are generally available only with NETSS line-listed data. Data contained in the IHS Area STD Profiles are restricted to years when STD cases submitted to NETSS were relatively complete for most states and reporting jurisdictions (i.e., 1998-present).

Case reports and corrections for 2009 sent to CDC through June 25, 2008, have been included in this report. Data and corrections received after this date will appear in subsequent issues and updates.

## **Adjustments to CDC STD Data**

To improve the quality of certain national and IHS Area analyses, several adjustments were made to the data prior to calculating rates. These procedures removed or redistributed cases and populations when one or more of the following conditions were present:

- If a state had >50% of its cases with unknown race/ethnicity, both the cases and populations were removed from the case and population databases prior to performing analyses involving race/ethnicity.
- If a state had ≤50% of its cases with unknown race/ethnicity, the cases with unknown race/ethnicity were redistributed to known race/ethnicity categories, based on the percentage of cases in each known category. This adjustment was made after cases had been summed over the geographic unit of the analysis (e.g., national, state, county, IHS Area).
- If a state did not report cases electronically to NETSS, by race and ethnicity, the populations of those states were removed from the population database in those years. This adjustment was made only for IHS and IHS Area analyses.

For U.S. cases and rates shown in this report, adjustments were made depending on the type of analysis in order to maintain consistency between data presented in this report and data presented in the CDC STD Surveillance Summaries.<sup>3</sup> Unadjusted U.S. case counts and rates are presented for STD totals and for analyses by sex; adjusted U.S. cases counts and rates are presented for analyses of sex and age.

## **Population Denominators and Rate Calculations**

Crude incidence rates (new cases/population) were calculated on an annual basis per 100,000 population. In this report, the 2007 rates for the U.S., IHS, and individual IHS Areas were calculated by dividing the number of cases reported from each area in 2007 by corresponding 2006 population estimates. The 2004 rates presented in this IHS Report may differ slightly since they are updated using 2004 populations. For subsequent reports, the 2007 rates will be updated using 2007 populations. For all other years, rates were calculated by dividing annual cases by the appropriate population estimate (e.g. 2001 cases divided by 2001 population). Specifics on population denominators used in this report are detailed below.

## **U.S. Denominators**

For years, 2000-2007, rates were calculated using the Census 2000

bridged-Race file developed by the Census Bureau and the National Center for Health Statistics (NCHS). Census 2000 was the first census to allow for racial identification as either a single race or in combination with other races; consequently, the Census 2000 data on race are not directly comparable with data from the 1990 census or earlier censuses. To address this inconsistency, NCHS and the Census Bureau developed the Census 2000 bridged-race file,<sup>6</sup> which bridges the 31 race categories specified in the 1997 Office of Management and Budget (OMB) standards (used in Census 2000) with the 4 race categories specified under 1977 OMB standards (used in the 1980 and 1990 censuses).<sup>7</sup>

For years 1990-1999, population counts were also updated to incorporate the bridged-race estimates based on the Census 2000 counts.<sup>6</sup> These files were prepared by the Census Bureau with support from the National Cancer Institute.

U.S. rates for 1984-1989 were calculated using Census Bureau population estimates for corresponding years.<sup>8</sup>

### AI/AN Denominators (National STD Profile)

National AI/AN rates, like U.S. rates, were calculated using national-level census population estimates. For 1984-1989, rates were calculated using AI/AN-specific Census Bureau population estimates.<sup>8</sup> For 1990-2007, rates were calculated based on estimates of identified AI/AN in the Census 2000 bridged-race file.<sup>6</sup>

### IHS Denominators (IHS Area STD Profiles)

Population denominators used to calculate IHS rates are based on estimates of AI/AN identified to be eligible for IHS services (i.e. the **IHS eligible population**).

IHS eligible population estimates are unique to this publication and are based on official county estimates from the Census 2000 bridged-race file. The Census Bureau enumerates those individuals who self-identify as being AI/AN. The IHS eligible population is estimated by counting

# Data Sources and Limitations

those AI/AN (as self-identified during the Census) who reside in specified counties in which IHS provides services or resources (“on or near” reservations)—within IHS, these counties are commonly referred to as contract health service delivery areas (CHSDAs) or service counties. In 2007, there were 625 service counties in 35 states; the current listing of service counties can be obtained by contacting IHS Division of Program Statistics (DPS) at [IHSStatsHelp@ihs.gov](mailto:IHSStatsHelp@ihs.gov) or accessing the Federal Register of June 21, 2007.<sup>9</sup> Based on current service counties, the estimated overall 2007 IHS eligible population is 1.77 million persons, comprising 60% of all AI/AN residing in the U.S. These people may or may not access IHS services.

IHS eligible population estimates are similar, but not identical, to IHS service population estimates, which are official IHS population counts referenced in IHS publications<sup>1,2</sup> and used by IHS when calculating AI/AN natality/mortality rates and other health statistics. In contrast to IHS eligible population estimates, IHS service population estimates are further adjusted using an intercensal smoothing process based on the most current 10 years of AI/AN natality and mortality data. This adjustment results in small differences between the IHS eligible and IHS service population estimates (Appendix A). Overall, in 2006, IHS eligible population estimates were 1.6% lower than IHS service population estimates (1,774,078 vs. 1,824,845 respectively). For individual IHS Areas, IHS eligible population estimates (when compared to IHS service population estimates) ranged between 8.4% lower in the Aberdeen Area and 4.8% higher in the Phoenix Area.

Populations and population rankings shown in the individual Area IHS profiles are based on the IHS service population since these are official. A population rank of 1 has the largest population; a rank of 12 has the smallest. Rates in the Area IHS profile graphs and tables use IHS eligible populations in order to compute rates by sex and age for each area.

## Healthy People 2010 Objectives

In January 2000, CDC released Healthy People 2010 (HP 2010), a set of health objectives for the U.S. to achieve over the first decade of the new century.<sup>10</sup> The year 2010 targets for the diseases addressed in this report are: gonorrhea—19 cases per 100,000 population, and primary and secondary syphilis—0.2 case per 100,000 population.

## **Data Limitations and Clarifications**

### **AI/AN and Hispanic Ethnicity**

IHS-specific races shown in the IHS Area Profiles section of this report are based on case reports and population estimates for all individuals identified as AI/AN, including AI/AN Hispanics and AI/AN non-Hispanics. This methodology is consistent with current practices at IHS DPS.

In contrast, AI/AN STD rates shown in the National STD Profile and as published in the annual CDC STD Surveillance Summaries include case reports and population estimates only for AI/AN non-Hispanics; STD cases which occurred among AI/AN Hispanics are included in the Hispanic rates.

Differences in how AI/AN Hispanics are categorized in the National Profile vs. IHS Area Profiles result from differences in how primary data were collected in the STD Surveillance System and NETSS databases.

### **Misreporting of AI/AN Race**

Previous studies have documented misreporting of AI/AN race on death certificates and in state STD surveillance databases,<sup>11,12</sup> resulting in under-estimates when characterizing the burden of disease among AI/AN people. Misreporting of AI/AN race occurs particularly in areas distant from traditional AI/AN reservations.<sup>11</sup> AI/AN and IHS rates presented in this report have not been adjusted for racial misreporting.

### **IHS Areas Containing Partial Service Counties**

Five of the IHS Areas (Albuquerque, California, Navajo, Phoenix, and Tucson) contain service counties which are shared between IHS Areas or are partially contained within an IHS Area. For these 17 partial service counties (Appendix B), IHS DPS has developed “percentage splits” (based on the 1990 census), which determine what proportion of the county’s AI/AN population lies within the jurisdiction of a given IHS Area. These percentage splits, which are based on geographic boundaries, tribal population counts and health care utilization data, are updated periodically.

For chlamydia and gonorrhea rates presented in this report, case counts and IHS populations for partial service counties were determined using percentage splits. This is the same methodology that IHS DPS currently uses when calculating natality and mortality rates involving partial service counties.

Because primary and secondary syphilis (P&S) rates are significantly lower than chlamydia and gonorrhea rates, attributing cases which occurred in partial service counties based on percentage splits could lead to substantial differences in rates as described in this report compared to actual disease rates. For the P&S cases which occurred in partial service counties during 1998-2007, rates were adjusted by reviewing case data with state STD database managers to determine which IHS Area the case should be assigned to, based on the patient's community of residence. Adjusted P&S case counts and rates are shown for the 5 affected IHS Areas (Albuquerque, California, Navajo, Phoenix, and Tucson).

### **Urban Indians and Non-Federally Recognized Tribes**

STD data specific to urban Indians and non-federally recognized tribes are not included in this report. Methodologies to describe STD rates in these populations must still be developed. Such data may be included in future issues and updates.

### **Reporting Practices**

Although most areas generally adhere to the case definition for STDs found in Case Definitions for Infectious Conditions under Public Health Surveillance,<sup>13</sup> there may be differences in the policies and systems for collecting surveillance data. Thus, comparisons of case numbers and rates among areas should be interpreted with caution. However, since case definitions and surveillance activities within a given area remain relatively stable, trends should be minimally affected by these differences. In many areas, the reporting from publicly supported institutions (e.g. STD clinics and IHS, tribal, or urban Indian health organizations) has been more complete than from other sources (e.g. private practitioners). Thus, trends may not be representative of all segments of the population.

## Reporting of Chlamydia Cases

Trends in chlamydia case reporting from many states and areas are more reflective of changes in testing, diagnosis, and reporting of cases, rather than actual trends in disease incidence. Because of this limitation, the CDC primarily monitors chlamydia trends not by rates (number of positive cases/population), but by positivity or estimated prevalence (number of positive cases/number tested).<sup>14</sup> In areas where chlamydia positivity data are limited or not available, it is important to publish data on chlamydia rates (as provided in this report) to emphasize the large numbers of chlamydia cases being detected. Chlamydia positivity data by IHS Area are not included in this report.

## Interpretation of Case Rates when Case Counts are Small

STD case rates for many analyses presented in this report are based on small case counts (e.g.  $\leq 20$  cases); such rates and trends should be interpreted with caution. Small case counts occur in analyses by sex and age as well as P&S analyses, and analyses involving IHS Areas with small populations (e.g. Tucson and Billings). Case counts corresponding to all rates shown in this report are provided in the tables section.

## New in This Report

- The 2004 report is expanded to include cases and rates from 2005-2007.
- The algorithm to redistribute cases with unknown race was modified to reduce the impact of rounding. This may have resulted in small changes in the estimated IHS Area cases and rates in some years.
- Counties in each IHS region were modified to be consistent with the CHSDA counties reported in the June 21, 2007 Federal Registry.<sup>9</sup> Changes included adding Torrance county NM to Albuquerque IHS area; Grand Parish and LaSalle Parish LA to the Nashville IHS area; Utah county UT to the Phoenix IHS area; and San Juan county WA to the Portland IHS area. Counties deleted were Hudspeth county TX from the Albuquerque IHS area; Pierce county WI from the Bemidji IHS area and Santa Cruz county AZ from the Tucson IHS area.

# Summary of Data

# Summary of Data

Sexually transmitted diseases (STDs) remain a major public health challenge in the U.S. While substantial progress has been made in preventing, diagnosing, and treating certain STDs in recent years, CDC estimates that 19 million new infections occurred in 2000, almost half of them among young people ages 15 to 24.<sup>15</sup> In addition to the physical and psychological consequences of STDs, these diseases also exact a tremendous economic toll. Direct medical costs associated with STDs in the U.S. are estimated at \$15.9 billion annually.<sup>16</sup>

This report summarizes 2007 national data and trends for chlamydia, gonorrhea, and primary and secondary syphilis (P&S) among American Indians and Alaska Natives (AI/AN). AI/ANs are one of the smallest racial groups in the U.S.—according to Census 2000. AI/ANs comprise between 0.9%-1.5% of the total U.S. population<sup>17</sup>—but are disproportionately affected by STDs. In 2007, reported rates of chlamydia, gonorrhea, and P&S among AI/AN were 1.7 to 4.5 times higher than comparable rates for whites.<sup>3</sup>

## Chlamydia

Across all races and ethnicities, chlamydia remains the most commonly reported infectious disease in the U.S. In 2007, 17,871 chlamydia diagnoses were reported among AI/AN, down from 19,267 cases in 2006. The national AI/AN rate of reported chlamydia in 2007 was 732.9 cases per 100,000 population, a decrease of 7.2% from 2006 (790.1 cases per 100,000 population). The 2007 chlamydia rate among AI/AN was 2.0 times higher than the U.S. rate (370.2 cases per 100,000 population).

### Large Disparity Between IHS and U.S. Rates

Among AI/AN residing in IHS service areas, the overall IHS chlamydia rate in 2007 was 760.1 cases per 100,000 population, which was 2.1 times higher than the corresponding U.S. rate; 4 IHS Areas, Aberdeen, Alaska, Billings, and Tucson —had chlamydia rates 3.1 to 5.8 times higher than the U.S. rate. For all populations, recent increases in reported cases and rates likely reflect the continued expansion of screening efforts and increased use of more sensitive diagnostic tests, rather than an actual increase in new infections. IHS areas with decreasing CT rates include Bemidji (-2.4%), Phoenix (-2.1%), Aberdeen (-6.4%), Navajo (-9.0%), Billings (-11.5%) and Nashville (-38.0%).

### Young Women Especially Affected

Chlamydia rates are higher among women than men and reflect the fact that women are far more likely to be screened for this infection. Chlamydia rates among women are highest among those ages 15-24 years. In 2007, the overall IHS rate among women ages 15-24 years was 4,460.0 cases per 100,000 population, which was 1.5 times higher than the corresponding U.S. rate (2,961.5 cases per 100,000 population). For individual IHS Areas, chlamydia rates among women 15-24 years ranged between 1,322.5 cases per 100,000 population in the California Area to 11,483.4 cases per 100,000 population in the Alaska area.

## Gonorrhea

Gonorrhea is the second most commonly reported infectious disease to the U.S. In 2007, 2,657 gonorrhea diagnoses were reported among AI/AN, down from 3,398 cases in 2006. The national rate of reported gonorrhea in 2007 among AI/AN was 107.1 cases per 100,000 population, a decrease of 21.8% from 2006 (136.9 cases per 100,000 population). The 2007 gonorrhea rate among AI/AN was slightly lower than the U.S. rate (118.9 cases per 100,000 population).

### **Overall 2007 IHS Rate Lower than U.S. Rate**

In 2007, the overall IHS gonorrhea rate of 99.9 cases per 100,000 population was slightly lower than the U.S. gonorrhea rate of 118.9 cases per 100,000. Gonorrhea rates for the overall IHS population increased from 81.6 to 119.7 cases per 100,000 population between 1998 and 2006 but declined in 2007. Nationally, gonorrhea rates decreased through 2004 to the lowest level since reporting began in 1941 (112.4 cases per 100,000 population).

### **High Gonorrhea Rates in 3 IHS Areas**

Reported gonorrhea rates in 2007 for 3 IHS Areas—Aberdeen, Alaska and Tucson—were 1.5 to 2.0 times higher than the U.S. rate. In 2007, the Alaska Area had the highest gonorrhea rate (240.4 cases per 100,000 population). Three IHS Areas—Albuquerque, Billings, and California—had rates <50% of the U.S. rate. For the overall IHS population in 2007, gonorrhea rates were higher for women (137.5 cases per 100,000 population) compared to men (61.2 cases per 100,000 population).

## Primary and Secondary Syphilis (P&S)

The rate of primary and secondary syphilis (P&S) in the U.S. decreased throughout the 1990s, and in 2000 reached an all-time low. However, over the past 6 years both the U.S. and AI/AN syphilis rates have been increasing. Between 2006 and 2007, the AI/AN P&S rate increased 6.2%, from 3.2 to 3.4 cases per 100,000 population; comparatively, the U.S. P&S rate increased 15.2% from 3.3 to 3.8 cases per 100,000 population. In 2007, 85 P&S diagnoses were reported among AI/AN, up from 80, in 2006.

### IHS Cases Primarily Occurring in the Southwest

In 2007, 54 of 63 P&S cases (86%) diagnosed within the IHS service area occurred in 4 IHS Areas in the Southwest—Albuquerque, Navajo, Phoenix and Tucson; 4 IHS Areas had no P&S cases in 2007. IHS cases in the Southwest have been increasing since 2000, with peaks in 2004 (56 cases) and 2007 (54 cases). During 2006-2007, among all IHS Areas, the greatest P&S rate increase occurred in the Tucson Area (from 0.0 to 45.0 cases per 100,000 population); the Navajo Area had the largest number of P&S cases (23) diagnosed in 2007.

### IHS Cases Evenly Distributed Between Men and Women

For overall IHS cases in 2007, the P&S male-to-female rate ratio was 1.0, which indicates a similar number of P&S cases occurring among AI/AN men and women. In contrast, the U.S. P&S male-to-female rate ratio in 2007 was 6.0, which indicates a disproportionate number of P&S cases occurring among men compared to women. This disparity reflects syphilis increases in the U.S. which have primarily occurred among men who have sex with men (MSM). Though P&S male-to-female rate ratios vary by IHS Area, these data suggest different patterns of transmission for syphilis among AI/AN compared to the general U.S. population.

# **National STD Profile**

**Chlamydia**

**Gonorrhea**

**Primary and Secondary Syphilis**

# Chlamydia

Chlamydia is the most common nationally notifiable disease in the U.S. and the sequelae of Chlamydia infection disproportionately affects young women.<sup>3</sup> Chlamydia infections are asymptomatic in most women and, if untreated, can result in serious complications, including pelvic inflammatory disease (PID), infertility, and ectopic pregnancy.<sup>18</sup> A pregnant woman infected with chlamydia can transmit infection to her child during delivery, potentially leading to neonatal pneumonia. In addition, chlamydia infections have been shown to facilitate the transmission of HIV.<sup>19</sup> Despite these complications, chlamydia is easily treated and cured with antibiotics.

In 2000, for the first time, regulations in all 50 states and DC required the reporting of chlamydia cases. Trends in chlamydia case reporting from many states and areas are more reflective of changes in testing, diagnosis, and reporting of cases, rather than actual trends in disease incidence. Because of this limitation, the CDC primarily monitors chlamydia trends not by rates (number of positive cases/population), but by positivity or estimated prevalence (number of positive cases/number tested). Only chlamydia rates are shown in this report.<sup>20</sup>

In 2007, 1,108,374 chlamydia infections were reported in the U.S. This case count corresponds to a rate of 370.2 cases per 100,000 population, a 7.5% increase from 2006 (344.3 cases per 100,000 population).

## Key Points and Trends

- In 2007, 17,871 of 1,108,374 chlamydia infections (1.6%) were reported among AI/AN. The AI/AN chlamydia rate decreased by 7.2% during 2006-2007 (2006 rate: 790.1 cases per 100,000 population). (Figure 1).
- In 2007, among all race/ethnicities, AI/AN had the second highest chlamydia rate (732.9 cases per 100,000 population), which was 4.5 times higher than the rate for whites (162.3 cases per 100,000 population). African-Americans had the highest chlamydia rate (1,398.7 cases per 100,000 population). (Figure 2).
- In 2007, the chlamydia rate among AI/AN women in the U.S. (1,158.2 cases per 100,000 females) was nearly 4 times higher than the rate among AI/AN men (293.8 cases per 100,000 males), likely reflecting a greater number of women screened for this infection. (Figure 3) This rate ratio was slightly higher than the rate ratio by sex in the total U.S. (543.6 cases per 100,000 females and 190.0 cases per 100,000 males; female to male rate ratio of 2.9).
- Among AI/AN women, the highest age-specific rates of reported chlamydia in 2007 were among 20- to 24-year-olds (4,626.3 per 100,000 females) and 15- to 19-year-olds (4,360.4 per 100,000 females). (Figure 4) These two age groups also represented the highest age specific rates among all women in the U.S. (15-19 years: 3,004.7 per 100,000 females and 20-24 years: 2,948.8 per 100,000 females).
- Age-specific rates among AI/AN men, while substantially lower than the rates in AI/AN women, were highest among 20- to 24-year-olds (1,163.3 cases per 100,000 males). (Figure 4) This age group also had the highest rates among all men in the U.S. (932.9 cases per 100,000 males).

# Gonorrhea

Gonorrhea is the second most common nationally notifiable disease in the U.S.<sup>3</sup> and, like chlamydia, is a major cause of PID, infertility, and ectopic pregnancy. Gonococcal infections may be transmitted from a pregnant woman to her child during delivery (potentially causing ophthalmic disease),<sup>18, 19</sup> and have also been shown to facilitate the transmission of HIV.<sup>20</sup> Gonorrhea is curable with antibiotics, though resistance to certain classes of antibiotics is an ongoing problem.<sup>3</sup>

From 1975 through 1997, gonorrhea declined 74% following implementation of the national gonorrhea control program in the mid-1970s.<sup>18, 19</sup> However, national gonorrhea rates have remained stable over the past 10 years.

In 2007, 355,991 cases of gonorrhea were reported in the U.S. These cases correspond to a rate of 118.9 cases per 100,000 population, a 0.7% decrease from 2006 (119.7 cases per 100,000 population).

## Key Points and Trends

- In 2007, 2,657 of 355,991 gonorrhea infections (0.7%) reported to CDC from the 50 states and DC occurred among AI/AN. The AI/AN gonorrhea rate decreased by 21.8% during 2006-2007 (2006 rate: 136.9 cases per 100,000 population). The total U.S. gonorrhea rate decreased only 0.7% during 2006-2007 (Figure 5).
- In 2007, among all race/ethnicities, AI/AN had the second highest gonorrhea rate (107.1 cases per 100,000 population), which was 3.1 times higher than the rate for whites (34.7 cases per 100,000 population). African-Americans had the highest gonorrhea rate (662.9 cases per 100,000 population) (Figure 6).
- In 2007, the gonorrhea rate among AI/AN women in the U.S. (143.4 cases per 100,000 females) was 2.1 times higher than the rate among AI/AN men (69.5 cases per 100,000 males) (Figure 7). For the U.S., 2007 gonorrhea rates were similar for both women and men (123.5 cases per 100,000 females and 113.7 cases per 100,000 males).
- Among AI/AN women, the highest age-specific rates of reported gonorrhea in 2007 were among 20- to 24-year-olds (578.7 per 100,000 females) and 15- to 19-year-olds (455.7 per 100,000 females) (Figure 8). These two age groups also represented the highest age-specific rates among all women in the U.S. (15-19 years: 647.9 per 100,000 females and 20-24 years: 614.5 per 100,000 females).
- Age-specific rates among AI/AN men, while substantially lower than the rates in AI/AN women, were highest among 20- to 24-year-olds (278.2 cases per 100,000 males) (Figure 8). This age group also had the highest rates among all men in the U.S. (450.1 cases per 100,000 males).

# Primary and Secondary Syphilis

Syphilis, in its primary and secondary stages, is a highly infectious, but easily curable, sexually transmitted disease (STD) which, if untreated, can lead to serious long-term complications, including stroke, heart disease, and death. Syphilis can be transmitted from untreated mothers to their fetuses, potentially leading to stillbirths and congenital deformities.<sup>21</sup> In addition, syphilis has been shown to increase the rate of HIV transmission by two- to five-fold.<sup>20</sup> For these reasons, syphilis prevention and control is a public health priority.

The rate of primary and secondary syphilis (P&S) decreased during the 1990s and reached an all-time low in 2000 (2.1 cases per 100,000 population). The low rate of infectious syphilis and the concentration of the majority of syphilis in a small number of geographic areas in the U.S. led to the development of the CDC's National Plan to Eliminate Syphilis in October 1999.<sup>22</sup> The plan was updated in 2006 to reflect changes in syphilis epidemiology. Since 2000, P&S rates in the U.S. have increased, with increases primarily occurring among men who have sex with men (MSM).<sup>23</sup>

In 2007, 11,466 P&S cases were reported in the U.S. This case count corresponds to a rate of 3.8 cases per 100,000 population, an 15.2% increase from 2006 (3.3 cases per 100,000 population).

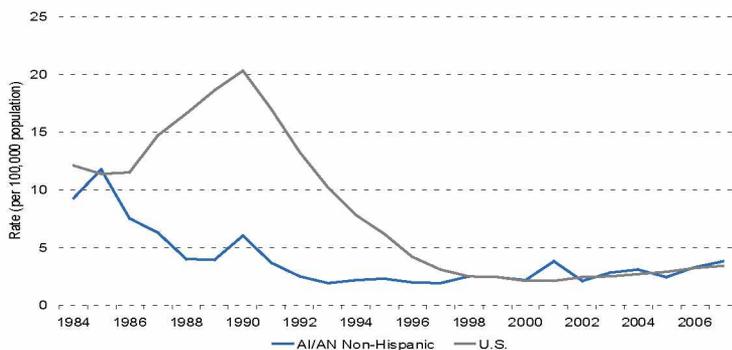

## Key Points and Trends

- In 2007, 85 of 11,466 P&S cases (0.7%) reported to CDC from the 50 states and DC occurred among AI/AN. The AI/AN P&S rate increased by 6.2% during 2006-2007 (2006 rate: 3.2 cases per 100,000 population). (Figure 9).
- In 2007, among all race/ethnicities, AI/AN had the third highest P&S rate (3.4 cases per 100,000 population), which was 1.7 times higher than the rate for whites (2.0 cases per 100,000 population). African-Americans (14.0 cases per 100,000) and Hispanics (4.3 cases per 100,000 population) had higher rates than AI/AN. (Figure 10).
- In 2007, the male-to-female P&S rate ratio among AI/AN was 1.7, indicating slightly more cases being diagnosed among men than women. (Figure 11). In contrast, for the total U.S., the male-to-female P&S rate ratio has risen steadily since 1996 (when it was 1.2) to 6.0 in 2007, suggesting an increase in syphilis among MSM during this time.
- In 2007, among AI/AN, the age-specific P&S syphilis rates were highest among women aged 25-29 years (7.8 cases per 100,000 population) and among men aged 30-34 years (18.2 cases per 100,000 population). (Figure 12). For the total U.S., the highest age-specific P&S rates were reported among women aged 20-24 years (3.5 cases per 100,000 population) and among men aged 25-29 years (14.9 cases per 100,000 population). In previous years, the highest age group among U.S. men was 35-39 years.

# Indian Health Service

Figure 16. Indian Health Service Counties, 2007

The IHS service area is comprised of 625 service counties in 35 states. The IHS service population is estimated by enumerating AI/AN who live in service counties.

#### Geography:

- States: 35 (AL, AZ, CA, CO, CT, FL, ID, IN, IA, KS, LA, ME, MA, MI, MN, MS, MT, NE, NV, NM, NY, NC, ND, OK, OR, PA, RI, SC, SD, TX, UT, WA, WI, WY)
- Counties: 625
- IHS Areas: 12

**Tribes:** 562

#### Service Population):

2007 (est.): 1,824,845  
(60% of all AI/AN in U.S.)

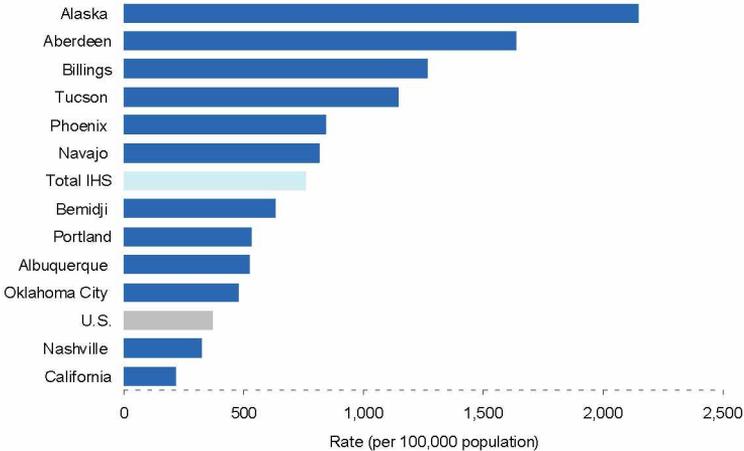

#### Notes for the STD graphs:

- IHS rates based on AI/AN living in service counties
- U.S. rates based on all races and ethnicities
- Exclusions: States with >50% of cases with unknown race excluded
- Adjustments: States with  $\leq 50\%$  of cases with unknown race have cases redistributed
- Cases from partial IHS Area service counties are redistributed
- IHS data source: NETSS
- U.S. data source: STDSS

# Chlamydia

Reference: Tables 8A, 8B, 9A, 9B

Figure 17. Chlamydia Rates among AI/ANs by IHS Area, 2007

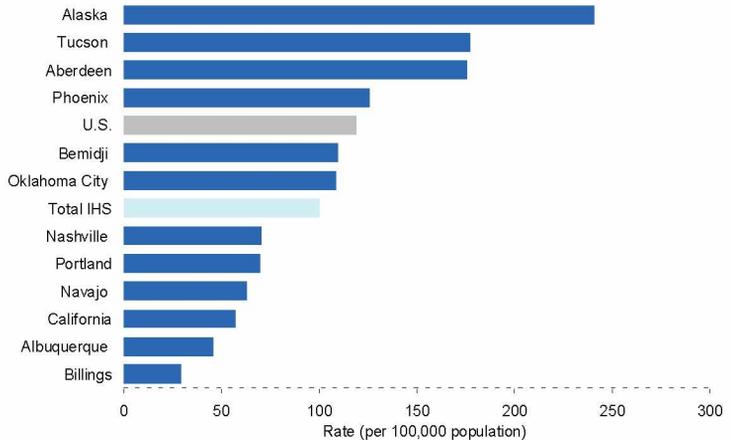

## Key Points and Trends

- In 2007, the overall IHS chlamydia rate was 2.1 times higher than the U.S. rate (760.1 and 370.2 cases per 100,000 population respectively)
- 10 of the 12 IHS Areas had higher 2007 chlamydia rates compared to the U.S. rate
- 4 IHS Areas (Aberdeen, Alaska, Billings, Tucson) had 2007 chlamydia rates 3.1 to 5.8 times higher than the U.S. rate.
- In 2007, all IHS Areas had female chlamydia rates that were between 2.7 and 5.8 times higher than male rates, likely reflecting greater numbers of women screened for this infection.
- During 2006-2007 overall chlamydia rates in the U.S. increased 7.5% (from 344.3 to 370.2), while overall IHS chlamydia rates decreased by 0.9%; IHS areas with the greatest increases were Tucson Area (89.8%) and Albuquerque Area (43.8%); the Nashville Area had the largest decrease (-38.0%).

# Gonorrhea

Reference: Tables 10A, 10B, 11A, 11B

Figure 18. Gonorrhea Rates among AI/ANs by IHS Area, 2007

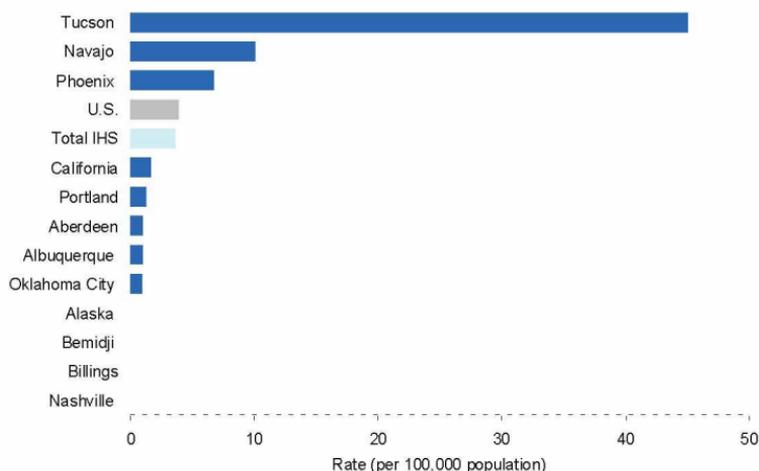

## Key Points and Trends

- In 2007, the overall IHS gonorrhea rate was lower than U.S. rates (99.9 and 118.9 cases per 100,000 population respectively)
- Four IHS Areas (Aberdeen, Alaska, Phoenix, Tucson) had 2007 gonorrhea rates higher than the U.S. rate
- In 2007, the overall IHS female gonorrhea rate was 2.2 times the male gonorrhea rate; all 12 IHS Areas had higher female gonorrhea rates than male gonorrhea rates
- During 2006-2007, overall gonorrhea rates in the U.S. decreased 0.7% (from 119.7 to 118.9), while overall IHS gonorrhea rates decreased by 16.3%; IHS areas with the greatest increases were Tucson Area (50.0%) and Albuquerque Area (19.9%); while 5 IHS Areas had decreases greater than 20% (Aberdeen, Billings, Nashville, Navajo and Phoenix)

## Primary and Secondary Syphilis (P&S)

Reference: Tables 12A, 12B, 13A, 13B

Figure 19. P&S Rates among AI/ANs by IHS Area, 2007

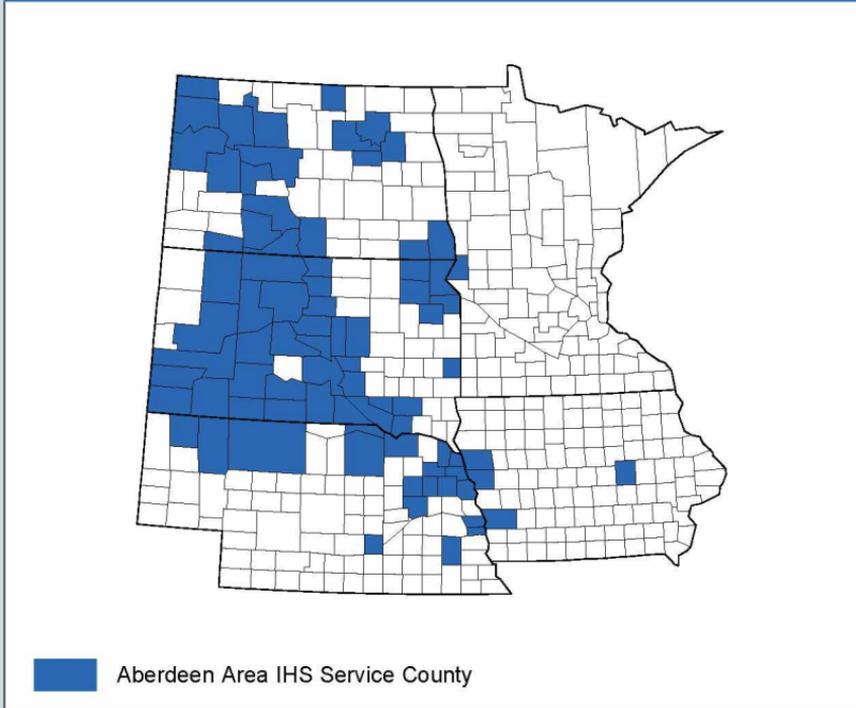

### Key Points and Trends

- In 2007, the overall IHS P&S rate was nearly the same as the U.S. rate (3.6 vs. 3.8 cases per 100,000 population respectively)
- Within IHS, 56 of the 63 (86%) P&S cases in 2007 occurred in 4 Areas in the Southwest {Navajo (23 cases), Tucson (16 cases), Phoenix (14 cases) and Albuquerque (1 case)}; 4 IHS Areas had no P&S cases in 2007
- In 2007, the P&S male-female rate ratio for IHS overall was 1.0, which indicates a similar number of cases occurring among men and women. The U.S. male-female ratio was 6.0
- During 2006-2007, overall P&S rates in the U.S. and the overall IHS increased 9.5% from 3.3 to 3.6 cases per 100,000 population; among IHS areas the largest increase occurred in the Tucson Area (from 0.0 to 45.0 cases per 100,000) and the Phoenix Area (from 3.8 to 6.7 cases per 100,000; the Navajo Area had the largest decrease in cases (from 33 to 23)

# Aberdeen Area IHS

## Table Notes

### Table 1A

*Data source:* STD Surveillance System Morbidity file, unadjusted • Cases with unknown sex are included in the Totals

*STD source:* 2007 CDC STD Surveillance Report, Tables 1, 3-5, 13-15, 25-27

### Table 1B

*Data source:* STD Surveillance System Morbidity file, unadjusted • Population source: NCHS bridged-race file of the U.S. Census population (1990-2006); U.S. Census Bureau estimates (1984-1989) • 2007 rates are computed using 2006 populations to be consistent with the 2007 CDC STD Surveillance Report

*STD source:* 2007 CDC STD Surveillance Report, Tables 1, 3-5, 13-15, 25-27

### Table 2A

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files, 1996-2007 and STD Surveillance System Morbidity file • All races, including AI/ANs, are non-Hispanic; Hispanics, in total, are shown as a separate race group • States with >50% unknown race/ethnicity values are excluded • Cases with unknown race/ethnicity and sex values are re-distributed to known categories based on percent-age of cases in each sex and race group • Total cases may not equal male plus female cases because of rounding in the re-distribution process • Total U.S. cases are unadjusted (no exclusions or re-distributions) and match National Table 1A • Total U.S. cases with unknown sex are included in the Totals

*STD source:* 2007 CDC STD Surveillance Report, Table 11A (cases by race/ethnicity group) and Tables 1, 3-5 (Total U.S.)

### Table 2B

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files with exclusions and re-distributions (race/ethnicity rates) and unadjusted STD Surveillance System Morbidity file (Total U.S.) • Population source: NCHS bridged-race file of the U.S. Census 2000 population with exclusions (rates of race/ethnicity groups) or no exclusions (Total U.S.) • 2007 rates are computed using 2006 populations

*STD source:* 2007 CDC STD Surveillance Report, Table 11B (rates by race/ethnicity group) and Tables 1, 3-5 (Total U.S.)

### Table 3A

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files, 2007 and STD Surveillance System Morbidity file • All races, including AI/ANs, are non-Hispanic; Hispanics, in total, are shown as a separate race group • No states are excluded • Cases with unknown race/ethnicity and sex values are re-distributed to known categories based on percentage of cases in each sex and race group • Total cases may not equal male plus female cases because of rounding in the re-distribution process • Total U.S. cases are unadjusted (no exclusions or re-distributions) and match National Table 1A • Total U.S. cases with unknown sex are included in the Totals

*STD source:* 2007 CDC STD Surveillance Report, Table 11A (cases by race/ethnicity group) and Tables 1, 3-5 (Total U.S.)

### Table 3B

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files with exclusions and re-distributions (race/ethnicity rates) and unadjusted STD Surveillance System Morbidity file (Total U.S.) • Population source: NCHS bridged-race file of the U.S. Census 2000 population with exclusions (rates of race/ethnicity groups) or no exclusions (Total U.S.) • Rates among persons 0-9 years of age are not shown as an age group but are included in the All Ages Total • 2007 rates are computed using 2006 populations

*STD source:* 2007 CDC STD Surveillance Report, Table 11B (rates by race/ethnicity group) and Tables 10 (Total U.S.)

### Table 4A

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files, 1996-2007 and STD Surveillance System Morbidity file • All races, including AI/ANs, are non-Hispanic; Hispanics, in total, are shown as a separate race group • States with >50% unknown race/ethnicity values are excluded • Cases with unknown race/ethnicity and sex values are re-distributed to known categories based on percent-age of cases in each sex and race group • Total cases may not equal male plus female cases because of rounding in the re-distribution process • Total U.S. cases are unadjusted (no exclusions or re-distributions) and match National Table 1A • Total U.S. cases with unknown sex are included in the Totals

*STD source:* 2007 CDC STD Surveillance Report, Table 21A (cases by race/ethnicity group) and Tables 1, 13-15 (Total U.S.)

### Table 4B

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files with exclusions and re-distributions (race/ethnicity rates) and un-adjusted STD Surveillance System Morbidity file (Total U.S.) • Population source: NCHS bridged-race file of the U.S. Census 2000 population with exclusions, 1990-1989 (rates of race/ ethnicity groups) or no exclusions (Total U.S.) • 2007 rates are computed using 2006 populations

*STD source:* 2007 CDC STD Surveillance Report, Table 21B (rates by race/ethnicity group) and Tables 1, 13-15 (Total U.S.)

### Table 5A

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files, 2007 • All races, including AI/ANs, are non-Hispanics, Hispanics, in total, are shown as a separate race group • No states are excluded • Cases with unknown race/ethnicity and sex values are redistributed to known categories based on percentage of cases in each sex and race group • Total cases may not equal male plus female cases because of rounding in the re-distribution process • Cases among persons 0-9 years of age are not shown as an age group but are included in the All Ages Total • Total U.S. cases are adjusted (no exclusions but cases of unknown sex and age are re-distributed to known age and sex groups).

*STD source:* 2007 CDC STD Surveillance Report, Table 21B (cases by race/ethnicity group) and Table 20 (Total U.S.)

### Table 5B

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files, 2007 with exclusions and re-distributions (race/ethnicity rates) and unadjusted STD Surveillance System Morbidity file (Total U.S.) • Population source: NCHS bridged-race file of the U.S. Census 2000 population with exclusions (rates of race/ethnicity groups) or no exclusions (Total U.S.) • Rates among persons 0-9 years of age are not shown as an age group but are included in the All Ages Total • 2007 rates are computed using 2006 populations

*STD source:* 2007 CDC STD Surveillance Report, Table 21B (rates by race/ethnicity group) and Tables 20 (Total U.S.)

**Table 6A**

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files, 1996-2007 and STD Surveillance System Morbidity file • All races, including AI/ANs, are non-Hispanic; Hispanics, in total, are shown as a separate race group • States with >50% unknown race/ethnicity values are excluded • Cases with unknown race/ethnicity and sex values are re-distributed to known categories based on percentage of cases in each sex and race group • Total cases may not equal male plus female cases because of rounding in the re-distribution process • Total U.S. cases are unadjusted (no exclusions or re-distributions) and match National Table 1A • Total U.S. cases with unknown sex are included in the Totals

*STD source:* 2007 CDC STD Surveillance Report, Table 33A (cases by race/ethnicity group) and Tables 1, 25-27 (Total U.S.)

**Table 6B**

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files with exclusions and re-distributions (race/ethnicity rates) and unadjusted STD Surveillance System Morbidity file (Total U.S.) • Population source: NCHS bridged-race file of the U.S. Census 2000 population with exclusions, 1990-1989 (rates of race/ethnicity groups) or no exclusions (Total U.S.) • 2007 rates are computed using 2006 populations

*STD source:* 2007 CDC STD Surveillance Report, Table 33B (rates by race/ethnicity group) and Tables 1, 25-27 (Total U.S.)

**Table 7A**

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files, 2007 • All races, including AI/ANs, are non-Hispanics, Hispanics, in total, are shown as a separate race group • No states are excluded • Cases with unknown age, race/ethnicity and sex values are redistributed to known categories based on percentage of cases in each age, race and sex group • Total cases may not equal male plus female cases because of rounding in the redistribution process • Cases among persons 0-9 years of age are not shown as an age group but are included in the All Ages Total • Total U.S. cases are adjusted (no exclusions but cases of unknown sex and age are re-distributed to known age and sex groups)

*STD source:* 2007 CDC STD Surveillance Report, Table 33A (cases by race/ethnicity group) and Table 33 (Total U.S.)

**Table 7B**

*Data source:* STD Surveillance System Age-Race/Ethnicity-Sex files, 2007 with redistributions for race/ethnicity rates and Total U.S. rate Population source: NCHS bridged-race file of the U.S. Census 2000 population (rates of race/ethnicity groups) or no exclusions (Total U.S.) • Rates among persons 0-9 years of age are not shown as an age group but are included in the All Ages Total • 2007 rates are computed using 2006 populations

*STD source:* 2007 CDC STD Surveillance Report, Table 33B (rates by race/ethnicity group) and Table 32 (Total U.S.)

**Table 8A**

*Data source:* NETSS, 1998-2007 (IHS cases) and STD Surveillance System Morbidity file (U.S. Total cases) • AI/AN cases include AI/AN Hispanics • IHS cases are all AI/AN cases reported from IHS service counties. If counties are split between IHS Areas, the cases are proportioned to each IHS Area based on established percentages (Appendix B). • States with >50% unknown race/ethnicity values are excluded (see the IHS Area STD Profiles section for details) • Cases with unknown age, race/ethnicity and sex values are re-distributed to known categories based on percentage of cases in each race group • Total cases may not equal male plus female cases because of rounding in the redistribution process • Total U.S. cases are unadjusted and match IHS National Table 1.

*STD source for Total U.S. cases:* 2007 CDC STD Surveillance Report, Tables 1 and 3-5

**Table 8B**

*Population source:* NCHS bridged-race file of the U.S. Census 2000 population with exclusions for IHS • AI/AN Hispanics are included in the AI/AN populations • IHS Populations are based on AI/AN living in IHS service counties. If counties are split between IHS Areas, the populations are proportioned based on established percentages (Appendix B) • Total U.S. rates are unadjusted • 2007 Total U.S. rates are computed using 2006 populations

*STD source for Total U.S. rates:* 2007 CDC Surveillance Report, Tables 1 and 3-5.

**Table 9A**

*Data source:* NETSS, 1998-2007 (IHS cases) and STD Surveillance System Age-Race/Ethnicity-Sex file, 2007 (U.S. Total cases) • AI/AN cases include AI/AN Hispanics • IHS cases are all AI/AN cases reported from IHS service counties. If counties are split between IHS Areas, the cases are proportioned to each IHS Area based on established percentages (Appendix B) • No states are excluded • Cases with unknown age, race/ethnicity values are re-distributed to known categories based on percentage of cases in each race group • Cases among persons 0-9 years of age are not shown as an age group but are included in the All Ages Total • Total cases may not equal male plus female cases because of rounding in the re-distribution process • Adjusted Total U.S. cases have no exclusions but age and sex unknowns are re-distributed.

*STD source for Total U.S. cases:* 2007 CDC STD Surveillance Report, Table 10.

**Table 9B**

*Population source:* NCHS bridged-race file of the U.S. Census 2000 population with exclusions for IHS • AI/AN Hispanics are included in the AI/AN populations • IHS Populations are based on AI/ANs living in IHS service counties. If counties are split between IHS Areas, the populations are proportioned based on established percentages (Appendix B) • Rates among persons 0-9 years of age are not shown as an age group but are included in the All Ages Total • 2007 Total U.S. rates are computed using 2006 populations.

*STD source for Total U.S. rates:* 2007 CDC STD Surveillance Report, Table 10

**Table 10A**

*Data source:* NETSS, 1998-2007 (IHS cases) and STD Surveillance System Morbidity file (U.S. Total cases) • AI/AN cases include AI/AN Hispanics • IHS cases are all AI/AN cases reported from IHS service counties. If counties are split between IHS Areas, the cases are proportioned to each IHS Area based on established percentages (Appendix B). • States with >50% unknown race/ethnicity values are excluded (see the IHS Area STD Profiles section for details) • Cases with unknown age, race/ethnicity and sex values are re-distributed to known categories based on percentage of cases in each race group • Total U.S. cases are unadjusted and match IHS National Table 1A

*STD source for Total U.S. cases:* 2007 CDC STD Surveillance Report, Tables 1 and 13-15

**Table 10B**

*Population source:* NCHS bridged-race file of the U.S. Census 2000 population with exclusions for IHS • AI/AN Hispanics are included in the AI/AN populations • IHS Populations are based on AI/ANs living in IHS service counties. If counties are split between IHS Areas, the populations are proportioned based on established percentages (Appendix B) • Total U.S. rates are unadjusted and match National Table 1B • 2007 Total U.S. rates are computed using 2006 populations.  
*STD source for Total U.S. rates:* 2007 CDC Surveillance Report, Tables 1 and 13-15.

**Table 11A**

*Data source:* NETSS, 1998-2007 (IHS cases) and STD Surveillance System Age Race/Ethnicity-Sex file, 2007 (U.S. Total cases) • AI/AN cases include AI/AN Hispanics • IHS cases are all AI/AN cases reported from IHS service counties. If counties are split between IHS Areas, the cases are proportioned to each IHS Area based on established percentages (Appendix B) • No states are excluded • Cases with unknown age, race/ethnicity and sex values are re-distributed to known categories based on percentage of cases in each race group • Total cases may not equal male plus female cases because of rounding in the redistribution process • Cases among persons 0-9 years of age are not shown as an age group but are included in the All Ages Total • Adjusted Total U.S. cases by sex and age have no exclusions but age and sex unknowns are re-distributed  
*STD source for Total U.S. cases:* 2007 CDC STD Surveillance Report, Table 20.

**Table 11B**

*Population source:* NCHS bridged-race file of the U.S. Census 2000 population with exclusions for IHS • AI/AN Hispanics are included in the AI/AN populations • IHS Populations are based on AI/ANs living in IHS service counties. If counties are split between IHS Areas, the populations are proportioned based on established percentages (Appendix B) • Rates among persons 0-9 years of age are not shown as an age group but are included in the All Ages Total • 2007 Total U.S. rates are computed using 2006 populations.  
*STD source for Total U.S. rates:* 2007 CDC STD Surveillance Report, Table 20

**Table 12A**

*Data source:* NETSS, 1998-2007 (IHS cases) and STD Surveillance System Morbidity file (U.S. Total cases) • AI/AN cases include AI/AN Hispanics • IHS cases are all AI/AN cases reported from IHS service counties. If counties are split between IHS Areas, the cases are proportioned to each IHS Area based on established percentages (Appendix B). • States with >50% unknown race/ethnicity values are excluded (see the IHS Area STD Profiles section for details) • Cases with unknown age, race/ethnicity and sex values are re-distributed to known categories based on percentage of cases in each race group • Total U.S. cases are unadjusted and match IHS National Table 1A  
*STD source for Total U.S. cases:* 2007 CDC STD Surveillance Report, Tables 1 and 26-28

**Table 12B**

*Population source:* NCHS bridged-race file of the U.S. Census 2000 population with exclusions for IHS • AI/AN Hispanics are included in the AI/AN populations • IHS Populations are based on AI/ANs living in IHS service counties. If counties are split between IHS Areas, the populations are proportioned based on established percentages (Appendix B) • Total U.S. rates are unadjusted and match National Table 1B • 2007 Total U.S. rates are computed using 2006 populations.  
*STD source for Total U.S. rates:* 2007 CDC Surveillance Report, Tables 1 and 26-28

**Table 13A**

*Data source:* NETSS, 1998-2007 (IHS cases) and STD Surveillance System Age-Race/Ethnicity-Sex file, 2007 (U.S. Total cases) • AI/AN cases include AI/AN Hispanics • IHS cases are all AI/AN cases reported from IHS service counties. If counties are split between IHS Areas, the cases are proportioned to each IHS Area based on established percentages (Appendix B) • No states are excluded • Cases with unknown age, race/ethnicity values are redistributed to known categories based on percentage of cases in each race group • Cases among persons 0-9 years of age are not shown as an age group but are included in the All Ages Total • Total cases may not equal male plus female cases because of rounding in the re-distribution process • Adjusted Total U.S. cases by sex and age have no exclusions but are redistributed.  
*STD source for Total U.S. cases:* 2007 CDC STD Surveillance Report, Table 33.

**Table 13B**

*Population source:* NCHS bridged-race file of the U.S. Census 2000 population with exclusions for IHS • AI/AN Hispanics are included in the AI/AN populations • IHS Populations are based on AI/ANs living in IHS service counties. If counties are split between IHS Areas, the populations are proportioned based on established percentages (Appendix B) • Rates among persons 0-9 years of age are not shown as an age group but are included in the All Ages Total • 2007 Total U.S. rates are computed using 2006 populations.  
*STD source for Total U.S. rates:* 2007 CDC STD Surveillance Report, Table 33

# Appendix A

## Comparison of IHS Service Population and IHS Eligible Population—2006 Estimates

IHS Area	IHS Service Population (Official)*	IHS Eligible Population (STD Report)**	Population Difference	% Difference
Aberdeen	114,890	105,248	-9,642	-8.4%
Alaska	119,999	111,458	-8,541	-7.1%
Albuquerque	104,428	105,053	625	0.6%
Bemidji	117,134	109,689	-7,445	-6.4%
Billings	65,848	61,877	-3,971	-6.0%
California	177,884	184,633	6,749	3.8%
Nashville	113,142	117,145	4,003	3.5%
Navajo	238,468	226,973	-11,495	-4.8%
Oklahoma City	353,513	328,168	-25,345	-7.2%
Phoenix	195,547	204,987	9,440	4.8%
Portland	188,161	183,251	-4,910	-2.6%
Tucson	35,831	35,596	-235	-0.7%
<b>IHS Total</b>	<b>1,824,845</b>	<b>1,774,078</b>	<b>50,767</b>	<b>-1.6%</b>

\* IHS service populations are estimates based on IHS adjustments of the Bridged 2000 Census Data and Vital Event Data<sup>5</sup>. Adjustment details are available at the IHS Division of Program Statistics at [IHSStatsHelp@ihs.gov](mailto:IHSStatsHelp@ihs.gov).

\*\*IHS eligible populations are estimates based on the Bridged 2000 Census Data AI/AN populations<sup>5</sup> of counties designated as IHS CHSDA counties in the June 21, 2007 Federal Register<sup>8</sup>. These populations were used to compute the IHS Area rates.

# Appendix B

## Counties Shared Between IHS Areas or Partially Contained Within an IHS Area —2007 Percentage Splits

State and County	IHS Area	Percentage of County Population assigned to IHS Area
<b>Arizona</b>		
Apache County	Navajo	98.747
	Phoenix	1.253
Coconino County	Navajo	97.404
	Phoenix	2.596
Maricopa County	Phoenix	99.73
	Tucson	0.27
Navajo County	Navajo	62.014
	Phoenix	37.986
Pinal County	Phoenix	93.371
	Tucson	6.629
<b>California</b>		
Fresno County	California	47.62
	Non-Service Area	52.38
Imperial County	Phoenix	92.577
	California	7.423
Riverside County	California	99.243
	Phoenix	0.757
